

Assignment Number: 1.5

NAME: N. Nanda Mukesh

H.T.NO: 2303A51410

BATCH: 24

Task 1: AI-Generated Logic Without Modularization (String Reversal Without Functions)

❖ Scenario

You are developing a basic text-processing utility for a messaging application.

❖ Task Description

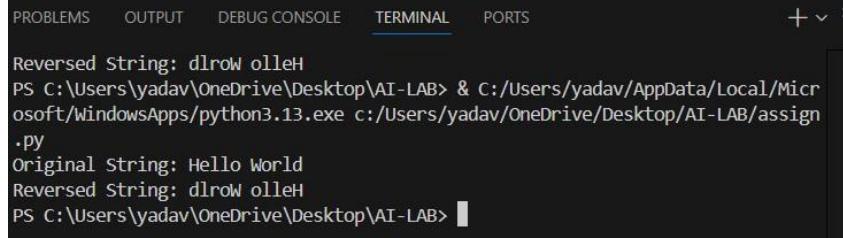

Use GitHub Copilot to generate a Python program that:

- Reverses a given string
- Accepts user input
- Implements the logic directly in the main code
- Does not use any user-defined functions

❖ Expected Output

- Correct reversed string
- Screenshots showing Copilot-generated code suggestions
- Sample inputs and outputs

```
1  #write a python program to reverse a string without using functions
2  def reverse_string(s):
3      reversed_str = ""
4      for i in range(len(s) - 1, -1, -1):
5          reversed_str += s[i]
6      return reversed_str
7
8  input_string = "Hello World"
9  output_string = reverse_string(input_string)
10 print("Original String:", input_string)
11 print("Reversed String:", output_string)
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS

Reversed String: dlrow olleH
PS C:\Users\yadav\OneDrive\Desktop\AI-LAB> & C:/Users/yadav/AppData/Local/Microsoft/WindowsApps/python3.13.exe c:/Users/yadav/OneDrive/Desktop/AI-LAB/assign.py
Original String: Hello World
Reversed String: dlrow olleH
PS C:\Users\yadav\OneDrive\Desktop\AI-LAB>

Task 2: Efficiency & Logic Optimization (Readability Improvement)

❖ Scenario

The code will be reviewed by other developers.

❖ Task Description

Examine the Copilot-generated code from Task 1 and improve it by:

- Removing unnecessary variables
- Simplifying loop or indexing logic
- Improving readability
- Use Copilot prompts like:
 - “Simplify this string reversal code” ▪
 - “Improve readability and efficiency”

Hint:

Prompt Copilot with phrases like

“optimize this code”, “simplify logic”, or “make it more readable”

❖ Expected Output

- Original and optimized code versions
- Explanation of how the improvements reduce time complexity

The screenshot shows a terminal window in a development environment. The code in the terminal is:

```
16 # optimize this string reversal code and improve readability and efficiency
17 def reverse_string_optimized(s):
18     return s[::-1]
19 input_string = "Hello World"
20 output_string = reverse_string_optimized(input_string)
21 print("Original String:", input_string)
22 print("Reversed String:", output_string)
23
24
```

The terminal output shows the execution of the script and the resulting strings:

```
osoft/WindowsApps/python3.13.exe c:/Users/yadav/OneDrive/Desktop/AI-LAB/assign
.py
original String: Hello World
Reversed String: dlrow olleH
PS C:\Users\yadav\OneDrive\Desktop\AI-LAB> []
```

Task 3: Modular Design Using AI Assistance (String Reversal Using Functions)

❖ Scenario

The string reversal logic is needed in multiple parts of an application.

❖ Task Description

Use GitHub Copilot to generate a function-based Python program that:

- Uses a user-defined function to reverse a string
- Returns the reversed string
- Includes meaningful comments (AI-assisted)
- ❖ Expected Output
- Correct function-based implementation
- Screenshots documenting Copilot's function generation
- Sample test cases and outputs

```

26  #give string reversal code with using functions
27  def reverse_string(s):
28      return s[::-1]
29  input_string = "Hello World"
30  output_string = reverse_st (variable) input_string: Literal['Hello World']
31  print("Original String:", input_string)
32  print("Reversed String:", output_string)
33

```

```

Original String: Hello World
Reversed String: dlrow olleH
PS C:\Users\yadav\OneDrive\Desktop\AI-LAB>

```

Task 5: AI-Generated Iterative vs Recursive Fibonacci Approaches (Different Algorithmic Approaches to String Reversal)

❖ Scenario

Your mentor wants to evaluate how AI handles alternative logic paths.

❖ Task Description

Prompt GitHub Copilot to generate:

- A loop-based string reversal approach
- A built-in / slicing-based string reversal approach
- ❖ Expected Output
- Two correct implementations
- Comparison discussing:

- Execution flow
- Time complexity
- Performance for large inputs
- When each approach is appropriate

```
36  #give different approaches to reverse a string like a loop based and built
37  def reverse_string_loop(s):
38      reversed_str = ""
39      for i in range(len(s) - 1, -1, -1):
40          reversed_str += s[i]
41      return reversed_str
42  def reverse_string_slicing(s):
43      return s[::-1]
44  input_string = "Hello World"
45  output_string_loop = reverse_string_loop(input_string)
46  output_string_slicing = reverse_string_slicing(input_string)
47  print("Original String:", input_string)
48  print("Reversed String using loop:", output_string_loop)
49  print("Reversed String using slicing:", output_string_slicing)
50  """
```
